

**Amendments to the Specifications**

Please substitute the specification of the originally filed translation with the Replacement Translation which follows this paper (Appendix A). The originally filed translation has missing lines that are present in the original PCT application. For example, the following lines are missing between page 1 and page 2 of the originally filed translation:

“... in the reaction system due to the catalytic effect of the oxidoreductase, the amount of the electron transporter which becomes reduced (or oxidized) reflects the concentration of the specific component. Response current is obtained in correlation with the amount of . . .”

The attached Replacement Translation is a true and correct translation of the PCT application and includes no new matter.

Please substitute the specification of this application with the Substitute Specification which follows this paper (Appendix B). A copy of the Substitute Specification with markings showing the changes relative to the Replacement Translation also follows this paper (Appendix C). The Substitute Specification includes editorial changes and idiomatic corrections. The Substitute Specification includes no new matter.
